Learn about Works with Nest

Works with Nest was created in 2014 as a way for connected home products from other manufacturers to take what Nest knows and personalize your experience, such as turning off the lights when you're away. The connected home has evolved significantly since then, and how people interact with and manage their devices has changed as well. Voice, smart displays, and whole-home automated routines are at the center of today's connected home, and the Google Assistant has evolved into a leading platform to deliver these experiences.
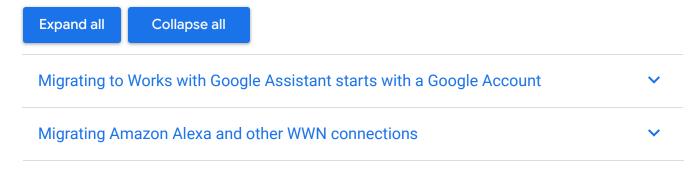

Transitioning to Works with Google Assistant

Works with Nest (WWN) was the original way that third party partners could access and control your Nest products. They were fully integrated with a Nest product and could check and change its status. Works with Nest connections will continue to work for those users who have a non-migrated Nest Account in the Nest app for as long as our partners support them.

Works with Google Assistant (WWGA) enables the Google Assistant to control all your connected products. You can use the Google Assistant to create Assistant Routines in the Home or Assistant apps. We've announced two new aspects of WWGA specifically for the products in your home: **Device Access** and **Home Routines**.

Read more on our blog to learn about Device Access and other ways to create a helpful home.

To learn more about the broader changes to our Works with Nest program, see our What's Happening at Nest FAQs page and updates to Works with Nest blog.

What is Works with Nest?   ⌃

Your Nest products use sensors and algorithms to learn about you and anticipate your needs. With Works with Nest, other products around your home can take what Nest knows and personalize your experience even more. Once you connect a product to Nest, it can automatically start doing things for you, without you having to program it.

The more products you have in your home, the more your home can start to take care of things for you automatically.

When it works with Nest, it just works.

Here are a couple examples of Works with Nest connections and what they can do.

Note: In the examples below, you'll need to have an active account in the Nest app, your home will need to have working Wi-Fi internet service, and your Nest products and your other products must be connected to Wi-Fi.

Example: When everyone's away from home (Home/Away/Assist)   ⌄

Example: When Nest Protect is sounding an alarm   ⌄

Our list of Works with Nest partners is growing. You might even own a product or two that works with nest already. Look for the Works with Nest badge on your product's packaging.
